<tbody>
<tr>
<td>Cross over double blind</td>
<td>furosemide hydrochlorothiazide versus placebo</td>
<td>patient with pulmonary heart disease due to severe chronic airflow obstruction and clinical features of congestive heart failure during respiratory failure</td>
<td>Cross over double blind</td>
<td>furosemide versus captopril 25 to 100 mg od versus captopril 12.5 to 50 mg bid + furosemide 25 mg od</td>
</tr>
<tr>
<td>Parallel groups double blind</td>
<td>furosemide (increased doses of frusemide) versus captopril (addition)</td>
<td>patients with moderate heart failure who still had symptoms despite 40 mg furosemide daily</td>
<td>Parallel groups double blind</td>
<td>intensified treatment with diuretics (furosemide- spironolactone) versus prenalterol 100-200 mg daily in addition to their basal treatment</td>
</tr>
<tr>
<td>Cross over double blind</td>
<td>furosemide + spironolactone vs prenalterol</td>
<td>patients with congestive heart failure</td>
<td>Cross over double blind</td>
<td>spironolactone 50mg + furosemide 20 mg versus spironolactone 50mg + butizide 5mg</td>
</tr>
</tbody>
</table>

More details and results:
- diuretics for heart failure in all type of patients at http://www.trialresultscenter.org/go-Q75
- aldosterone blockade for heart failure in all type of patients at http://www.trialresultscenter.org/go-Q488
